Session Report • May 03, 2026

■ Summary

Java is a programming language used to create computer programs, apps, and websites. It's like writing instructions for a computer to follow, but instead of using words, you use code.

Q2:

python

A2:

■ **Introduction to Python** Python is a high-level, interpreted programming language that is widely used for various purposes such as web development, scientific computing, data analysis, artificial intelligence, and more. It is known for its simplicity, readability, and ease of use, making it a great language for beginners. --- ■ **Basic Syntax** * **Indentation** → Python uses indentation (spaces or tabs) to define block-level structure, unlike other languages that use curly brackets or keywords. * **Variables** → You can assign a value to a variable using the assignment operator (=). For example: `python x = 5 # assign the value 5 to variable x` * **Print Function** → The `print()` function is used to output text or values to the screen. For example: `python print("Hello, World!") # print the string "Hello, World!"` * **Comments** → Comments start with the `#` symbol and continue until the end of the line. For example: `python # This is a comment x = 5 # assign the value 5 to variable x` --- ■ **Data Types** * **Integers** → Whole numbers, either positive, negative, or zero. For example: `python x = 5 # integer` * **Floats** → Decimal numbers. For example: `python x = 3.14 # float` * **Strings** → Sequences of characters, either enclosed in quotes or apostrophes. For example: `python x = "Hello, World!" # string` * **Boolean** → A logical value that can be either `True` or `False`. For example: `python x = True # boolean` --- ■ **Functions** Functions are blocks of code that can be executed multiple times from different parts of your program. Here's an example of a simple function: `python def greet(name): print("Hello, " + name + "!") greet("John") # call the function with the argument "John"` --- ■ **Control Structures** * **If-Else Statements** → Used to make decisions based on conditions. For example: `python x = 5 if x > 10: print("x is greater than 10") else: print("x is less than or equal to 10")` * **For Loops** → Used to iterate over sequences (such as lists or strings). For example: `python fruits = ["apple", "banana", "cherry"] for fruit in fruits: print(fruit)` This is just a brief introduction to Python. There's much more to learn, but this should give you a good starting point!

Q3:

java

A3:

■ **Introduction to Java** Java is a high-level, object-oriented programming language that is widely used for various purposes such as Android app development, web development,

desktop applications, and more. It is known for its platform independence, strong security features, and vast ecosystem of libraries and tools. --- ■ **Basic Syntax** * **Variables** → You can declare a variable using the ``type` `variableName`` syntax. For example: ```java int x = 5; // declare an integer variable x ``` * **Data Types** → Java has several built-in data types, including: + **Integers** (``int``): whole numbers, either positive, negative, or zero. + **Floats** (``float``): decimal numbers. + **Strings** (``String``): sequences of characters. + **Booleans** (``boolean``): logical values that can be either ``true`` or ``false``. * **Operators** → Java supports various operators for arithmetic, comparison, logical, and assignment operations. For example: ```java int x = 5; int y = 3; int result = x + y; // add x and y ``` * **Control Structures** → Java uses ``if-else`` statements and ``switch`` statements for decision-making, and ``for`` and ``while`` loops for iteration. For example: ```java int x = 5; if (x > 10) { System.out.println("x is greater than 10"); } else { System.out.println("x is less than or equal to 10"); } ``` --- ■ **Object-Oriented Programming (OOP) Concepts** * **Classes** → A class is a blueprint for creating objects. It defines the properties and behavior of an object. For example: ```java public class Car { private String color; private int speed; public Car(String color, int speed) { this.color = color; this.speed = speed; } public void accelerate() { speed++; } } ``` * **Objects** → An object is an instance of a class. It has its own set of attributes (data) and methods (functions). For example: ```java Car myCar = new Car("red", 60); myCar.accelerate(); System.out.println(myCar.speed); // prints 61 ``` * **Inheritance** → A class can inherit properties and behavior from another class. For example: ```java public class ElectricCar extends Car { private int batteryLevel; public ElectricCar(String color, int speed, int batteryLevel) { super(color, speed); this.batteryLevel = batteryLevel; } public void chargeBattery() { batteryLevel++; } } ``` --- ■ **Methods** * **Method Overloading** → A class can have multiple methods with the same name but different parameters. For example: ```java public class Calculator { public int add(int a, int b) { return a + b; } public double add(double a, double b) { return a + b; } } ``` * **Method Overriding** → A subclass can override a method from its superclass. For example: ```java public class ElectricCar extends Car { @Override public void accelerate() { speed += 10; } } ``` --- ■ **Exception Handling** * **Try-Catch Blocks** → Used to handle exceptions that may occur during execution. For example: ```java try { int x = 5 / 0; } catch (ArithmeticException e) { System.out.println("Cannot divide by zero!"); } ``` This is just a brief introduction to Java. There's much more to learn, but this should give you a good starting point! ---

Q5:

quiz on html

A5:

Select difficulty level: Easy Medium Hard

Q6:

quiz on html

A6:

Select difficulty level: Easy Medium Hard

A7:

Generating medium quiz on html...

A8:

■ Starting medium quiz on html! Check the Quiz tab.

A9:

■ Explanation: The tag is used to define a section of navigation links or introductory content for a document or section.

A10:

■ Explanation: The tag is used to create a dynamic graphics context for drawing graphics, charts, and other visual elements.

A11:

■ Explanation: The tag is used to define strong importance for the text, while the tag is used to define bold text.

A12:

■ Explanation: The tag is used to define a section of navigation links for a document or section.

A13:

Quiz completed! Your score: 1/5 (20%). Keep practicing! Focus on the fundamental concepts.
