Video ID:	KJgsSFOSQv0
Topics Covered:	8

Key Topics

1. Gonna
2. Here
3. Want
4. Variable
5. Going
6. Program
7. Inside
8. Print

Summary

Hey, welcome to Giraffe Academy My name is Mike in this course I'm gonna be teaching you guys everything you need to know to get started in the C programming language C is an awesome programming language and it's actually one of the oldest programming languages around in fact A lot of modern programming languages are based off of C so it's a really good idea if you want to get into C or even if you're trying to get into something like C++ to learn the basics and in this course, we're gonna cover everything you need to know I'm gonna talk to you guys about installing a text editor and using the C compiler and we're gonna write some basic code I'll talk to you guys about you know, what is a program and how the program's work and how does C Read the instructions that you give it and we're gonna get into some more advanced stuff We're gonna look at things like if statements and loops we're gonna create different variables We're gonna talk about the different types of data that you can use and C then we're gonna get more advanced We're gonna talk about things like structures and the functions. We're going to talk about pointers And basically I'm just gonna give you a full overview of all of the core concepts in C So by the end of this course, you'll have a really good understanding and a really good foundation Which you can build on you can kind of go forward and learn some more I'm really excited to be bringing you guys this basic course on C I'm really excited if you guys to dive in and start using these tutorials So feel free to click around through all the videos and hopefully you'll learn something awesome about C In this tutorial I'm gonna talk to you guys about getting everything set up to start programming in C now in order to program in C We're actually going to need two things The first thing we're gonna need is an environment where we can write our C programs Now there's a bunch of these different environments. All you need is just a text editor so anything that can you know, allow you to Write text and then save that text in a specific file format is gonna work although when we're working with C a lot of times it can be useful to use a special environment called an IDE an IDE stands for

integrated Development environment. Basically, this is a special text editor which makes it a lot easier for us to write our C programs And so I'm gonna show you guys how to install an IDE called code blocks the second thing We need to write our C programs is going to be something called a C compiler now C is a programming language It means we can basically write out You know instructions that we want to give to the computer but eventually for the computer to be able to execute those instructions they have to be Compiled which basically means like translated or transformed into a language that the computer can understand So we're gonna basically download and install a special program that will do that for us. So let's get started I am going to come over to my web browser and I'm just gonna go up to the Google search bar.

Questions & Answers

Question:

Summarize the video in simple terms, list key concepts, give important points, and generate 3 interview questions

Answer:

Based on the transcript: We're going to talk about pointers And basically I'm just gonna give you a full overview of all of the core concepts in C So by the end of this course, you'll have a really good understanding and a really good foundation Which you can build on you can kind of go forward and learn some more I'm really excited to be bringing you guys this basic course on C I'm really excited if you guys to dive in and start using these tutorials So feel free to click around through all the videos and hopefully you'll learn something awesome about C In this tutorial I'm gonna talk to you guys about getting everything set up to start programming in C now in order to program in C We're actually going to need two things The first thing we're gonna need is an environment where we can write our C programs Now there's a bunch of these different environments So that's kind of the basics of writing a program That's essentially all you need to know when we're writing a program we're specifying a list of instructions that we want the computer to carry out and Depending on which instructions we give the computer and which order we give them and how complex the instructions are That'll determine what the program does and as we go through this course, we're gonna learn more and more complex instructions we're also going to learn how we can take simple instructions like printf and Do different things with them to make our programs a lot more powerful So let's get started the first thing I want to show you guys is two-dimensional arrays so down here we can create a 2d array and actually the concepts that I'm showing you in this video can apply to Multi-dimensional arrays so not only two dimensions but three four or five really as many dimensions as your heart desires So in order to create a two-dimensional array, I'm just gonna make an array of numbers So I'm just gonna say int and we'll give this a name.
